[EN] 03. Integrating with Single Sign-On systems

The dLibra system can cooperate with Single Sign-On systems. That allows users to use several portals through just one user account (for example, a student can use one user account for logging into his or her university website and its digital library website). Having logged into one of the portals, the user can navigate all the portals connected within the framework of the Single Sign-On service, without having to enter a login and a password in each of them.
