

## [EN] 06. Importing Metadata from the .properties Format

`.properties` is a filename extension, mainly of files used in the Java language and related technologies. Its purpose is to store the configuration parameters of an application.

It is recommended to use a dedicated editor for creating a property file. Here is a sample `.properties` file with metadata for exporting:

**metadata.properties**

```
pl.Title.0=Przyk\u0142adowa publikacja  
pl.Creator.0=Jan Kowalski
```

That file will import the following values in Polish:

- Title: Przykładowa publikacja
- Twórca: Jan Kowalski
